

The Pygame Engine!

main.py
Imports `src.Engine` object as the engine then
Runs a default game based on a hard-coded "init.yaml" file

src.Engine

Loads the game per a given yaml file and runs connects up all the code. It should ALWAYS be the top node of the tree. It mainly connects input to a scene.

Game loop is:
Update input
Update all nodes in the current scene
Draw the updated scene to the monitor

src.scene.Scene

A data structure for all the nodes being interacted with at one time. Multiple scenes may be stored in engine only one is getting updated at a time. The scene manages and keeps track of all the nodes that were placed in it. It can load and save itself.

Drawing Layers of Sprites (in Sprite Groups)
